

HOW DO I INSTALL THE DOGGIE DOOLEY?

Select a site away from the house. It is recommended the location should be reached by a garden hose. Dig a round hole 48" (120 cm) deep by 14" (35.5 cm) in diameter. Use a post hole digger if possible, otherwise use a garden spade. Drop the Doggie Dooley into the ground hole. The shoulder flange should rest firmly on the ground level. The unit requires normal ground drainage. Do not install in an area with heavy clay soil. Find a location in your yard with minimum clay content in the soil.

STARTING THE DOGGIE DOOLEY

Fill the tank with about 6 gallons (22 liters) of water mixed with 2 tablespoons of digester powder. Clean the yard of dog waste and drop it into the tank – it is important to clean your yard daily or as regularly as possible. Do not overload the Doggie Dooley with several days of waste at one time. Add a gallon (4 liters) of fresh water each time you add waste. Adding water is very important to keeping the unit working properly. Water should overflow down the overflow tube each time it is added.

ADD DIGESTER POWDER WEEKLY (1 TABLESPOON PER DOG PER WEEK)

If you have not used the Doggie Dooley for a period of 2 weeks or more, it will be necessary to repeat the above start up procedure.

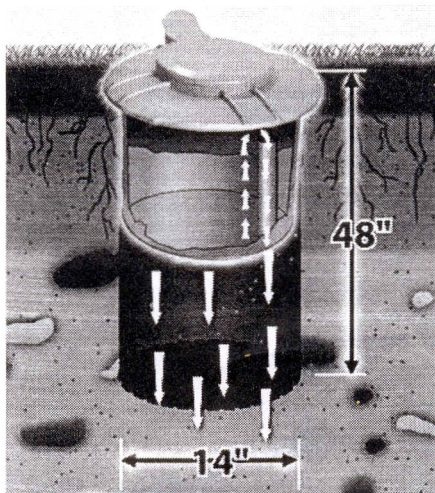

WHAT IS DIGESTER POWDER?

The unit includes our Super Dooley Digester Powder. Each tablespoon of powder contains billions of patented bacterial and enzyme cultures that double every 20 to 30 minutes.

 - NON-TOXIC
 - NON-CAUSTIC
- ENVIRONMENTALLY SOUND
 - CONTROLS ODORS
- SPECIALLY FORMULATED CHEMICAL DIGESTER POWDER FOR PET WASTE

CAN I USE THE DOGGIE DOOLEY IN THE WINTER TIME?

When the ground temperature drops below 40 degrees F, the Doggie Dooley will no longer break down waste. It is NOT necessary to empty the unit for the Winter season. SIMPLY DO NOT ADD DOG WASTE, DIGESTER POWDER OR WATER. Follow the start up directions again in the Spring.

CAPACITY: UP TO 2 LARGE OR 4 SMALL DOGS

HELPFUL HINTS

1. Continued, daily use is very important; do not overload the system with a week's worth of pet waste at one time.
2. If insects appear, this is a sign the unit needs more water. You may use a bug spray if necessary.
3. The rate of waste breakdown will vary with temperature. Digestive action starts at 40 degrees F and increases as the temperature rises.
4. Too much chlorine in your water can stop or slow the digestive action. If you suspect your water has a high chlorine content, leave the bucket of water out in the sun for a day; the sunlight will quickly evaporate the chlorine.

DIGESTER POWDER REFILLS

Our Super Dooley Digester Powder and Waste Terminator Brands are available from many local pet stores, mail order catalogs or on the Internet.

They are also available mail-order from the factory. Visa, Mastercard, and American Express as well as Check or Money order are accepted.

DIGESTER CAUTIONS

Avoid contact with eyes and open wounds; it may cause irritation. Do not take internally. Do not use with other chemicals—chlorine, acids, or caustics can affect the natural biological action. FIRST AID: If contact occurs with the eyes, wash with water for at least 15 minutes. Get prompt medical attention if irritation occurs. If contact occurs with open wounds, wash with soap and water. If accidentally ingested, rinse mouth and throat with water.
