

GRAND H.A.™

Grand H.A.™ provides 300 mg of Hyaluronic Acid per serving, the highest level available. Hyaluronic Acid (HA) is the chief component of synovial fluid that cushions and lubricates the joints. It plays an important role in increasing the viscosity and reducing friction between articular surfaces.

Grand H.A. contains Type II Collagen, a new US patented "Super Ingredient" clinically proven for rapid, effective absorption and promotion of joint health. Type II Collagen provides a matrix of HA molecules at 1/90th of their original size, Type II Collagen, and Depolymerized Chondroitin Sulfate. The ratio of these three ingredients match the natural structure found in articular cartilage. Grand H.A. with Type II Collagen represents a new dimension in joint technology - a more scientific approach for ultimate joint care.

PRODUCT FACTS

	Per 1oz. (28.5 g) unit
Hyaluronic Acid	300 mg
Type II Collagen	1,000 mg
Depolymerized Chondroitin Sulfate	350 mg

"For the last few years, I have fed Grand Meadows supplements with very good results. I recently included Grand H.A. for Tinus, our Grand Prix performance horse and breeding stallion, and immediately saw an improvement in his performance. Tinus is competing and performing in many different exhibitions all over the country. Grand Meadows products help him maintain a high level of fitness, energy, and strength for the stresses of competition and exhibitions."

Sabine Schut-Kery

USDF Bronze, Silver, and Gold medal winner
